

Project Review

Residential Hot Water

Domestic hot water, London.

The customer contacted us via their architects, explaining that they were renovating their Mews property in London and they were looking at renewable technologies to enhance the renovation work and help save energy costs for the future.

The house had limited flat roof space and complicated pipe runs to the hot water cylinder in the property.

We designed, supplied, and installed 3 LaZer2 solar thermal collectors, generating c. 3MWh-th.

The 2-man team led by lead LaZer2 installation engineer, Nick Martyn, and project managed by our Technical Director, Duncan Lee, installed and commissioned the system.
